Enduring Terror: The Effects of the Boston Marathon Bombing on Competitive Performance

Alexander Cardazzi Zachary Rodriguez

The Boston Marathon

The Boston Marathon is the world's oldest annual marathon (est. 1897) and one of the most prestigious. Only other "World Majors" in the US are in NYC and Chicago.

- Athletes must* qualify for the Boston Marathon.
- Qualifying times are relative to age and gender.
- The race is organized into waves (2013 had three).
- The final wave contains "charity" runners.

On April 15, 2013, at 2:49 PM, two bombs detonated near the finish line, killing three people and wounding hundreds more.

Research Question

We ask: what are the effects of *direct* experience of a terrorist attack on future performance & participation in competitive environments?

Terrorist events like the 9/11 Attacks (Metcalfe et al., 2011) and the 2013 Boston Marathon Bombing (Clark et al., 2020) reduced self-reported happiness and increased stress among the American population in the week (or two) following the attack.

The 117th (2013) Boston Marathon

Finishing Status by Wave:

- 1.6% of athletes in wave one DNF.
- 4.2% of athletes in wave two DNF.
- 64% of athletes in wave three DNF.
  - 1,183 out of 2,663 (44.4%) non-charity runners DNF.
  - 3,992 out of 5,429 (73.5%) charity runners DNF.

We focus on runners in wave three, and observe their performance across other races.

Data Sources

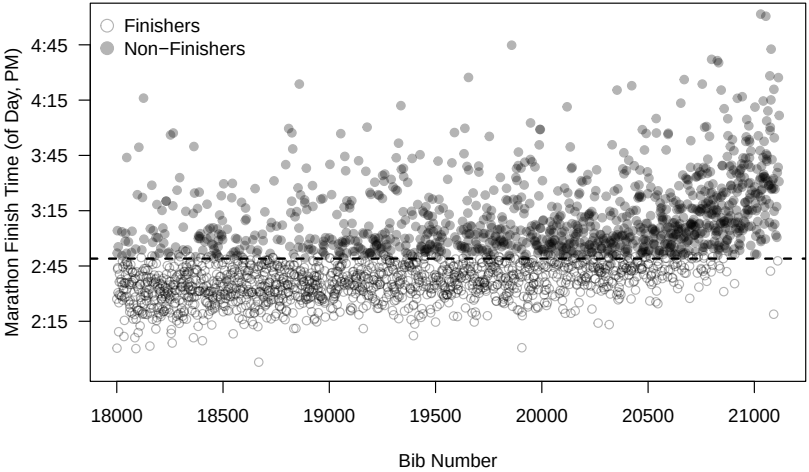
From the Boston Athletic Association, we collect performance "split times," bib numbers, demographics (gender, age, residence) and registration information for the 2009-2017 Marathons (and 2001-2008).

We also collect similar information from the New York City, Chicago, and Marine Corps (Washington DC) Marathons.

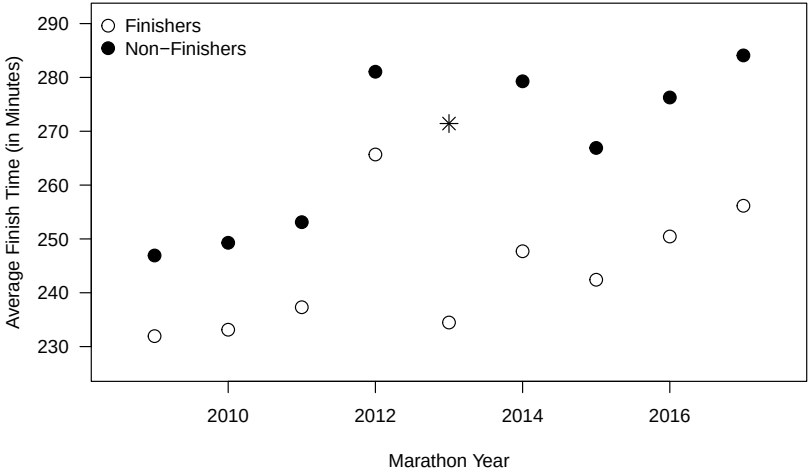
Summary Statistics from 2013

Race Status		Mean	St. Dev.	Min	Median	Max
Finishers	Fin. Time	234.47	9.07	192.72	235.03	255.62
	Qual. Time	238.33	9.87	195	235	295
	Bib Num.	19192.77	769.07	18000	19113	21110
	Male	0.18	0.39	0	0	1
	Age	51.68	7.32	25	50	80
	Foreign	0.2	0.4	0	0	1
Non-Finishers	Fin. Time	271.44	22.65	237.35	264.25	484.98
	Qual. Time	246.47	15.8	185	240	310
	Bib Num.	20008.29	833.91	18002	20185.5	21117
	Male	0.31	0.46	0	0	1
	Age	57.04	8.67	23	57	82
	Foreign	0.2	0.4	0	0	1

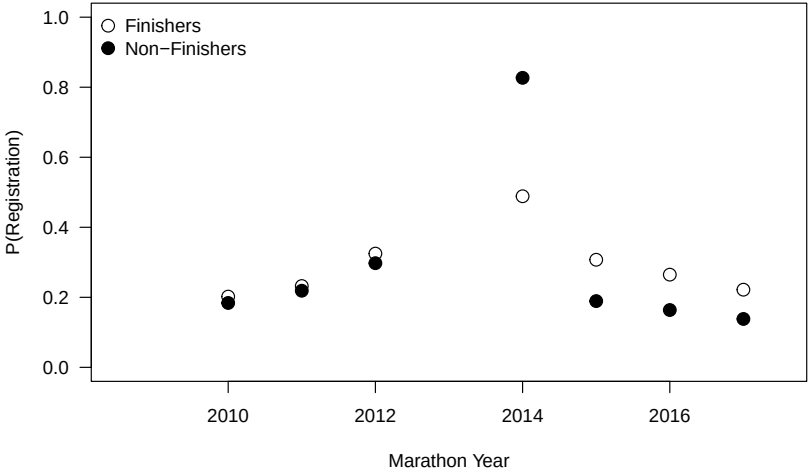
2013 Bib Number vs Finish Time



Performance Over Time



Participation Over Time



Research Design

We model athlete i's performance in marathon t as:

$$\text{Time}_{it} = \delta\ (\text{DNF2013}_i \times \text{Post}_t) + \beta\ \text{Bib}_{it} + \mu_i + \tau_{a(i)g(i)t} + \epsilon_{it} \tag{1}$$

where:

δ measures the relative performance change for diverted runners compared to those who finished

β controls for pre-race expectations

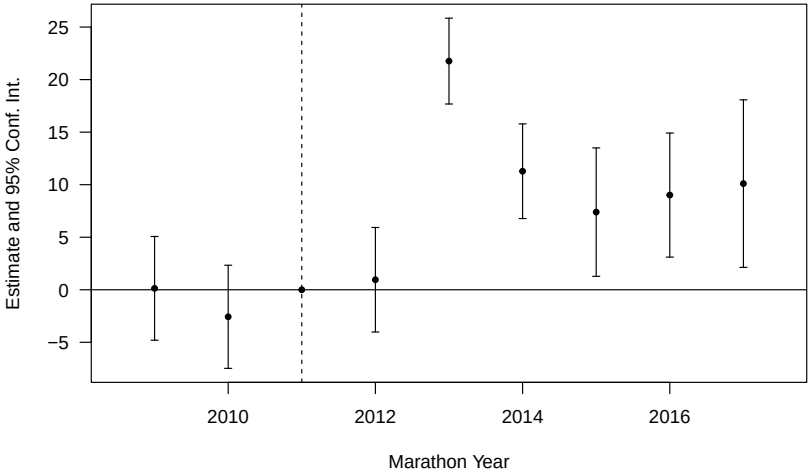
μ_i is a runner-specific fixed effect

$\tau_{a(i)g(i)t}$ is an age-gender-year fixed effect

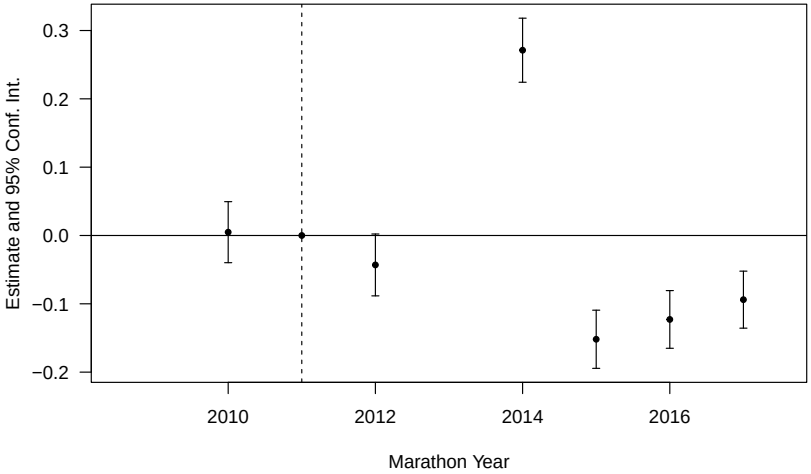
Research Design

1. First, we test for changes in performance at, and participation in, the Boston Marathon
2. Next, we examine these individuals *outside* of Boston.
3. Then, we compare both groups to individuals who were absent in 2013, separately estimating the effect for finishers and non-finishers.
4. Finally, we use a "placebo" event in 2005 to test to what extent our results are driven by our identification strategy.

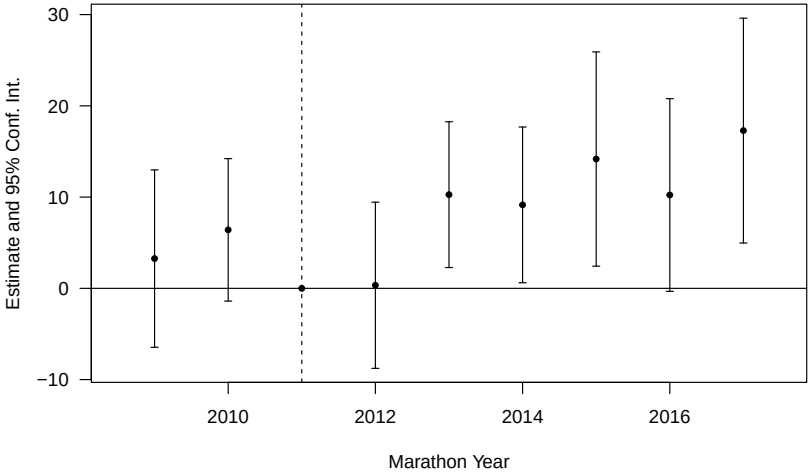
Results: Performance in Boston



Results: Participation in Boston



Results: Performance Outside Boston



Results: Participation Outside Boston

	Chicago	Washington DC	New York City	All

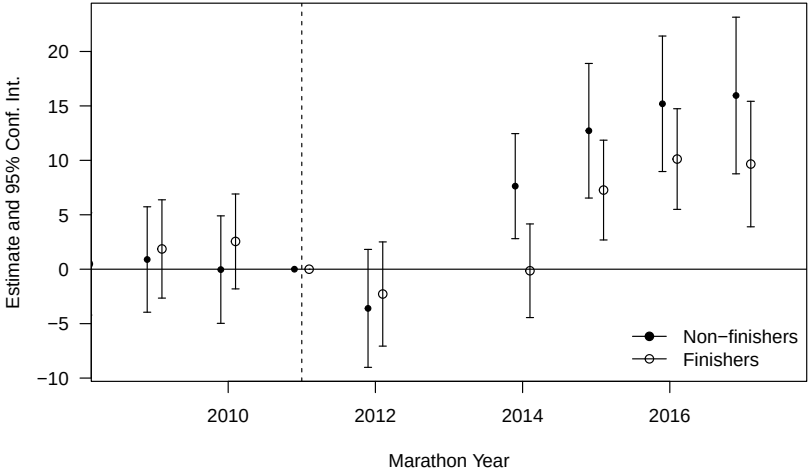
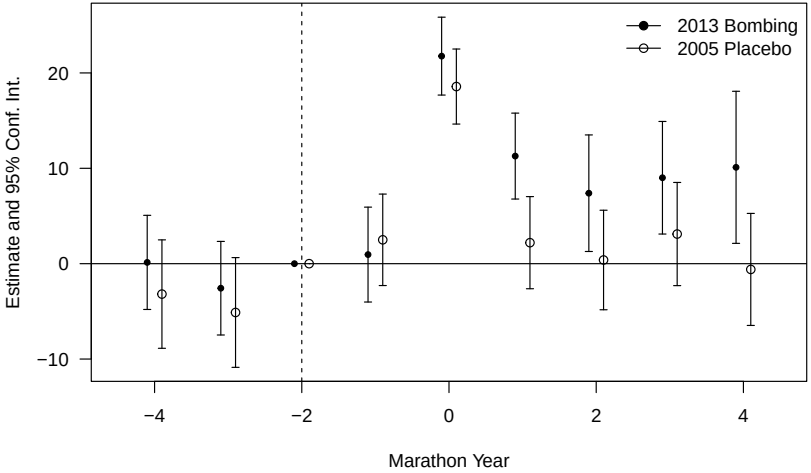
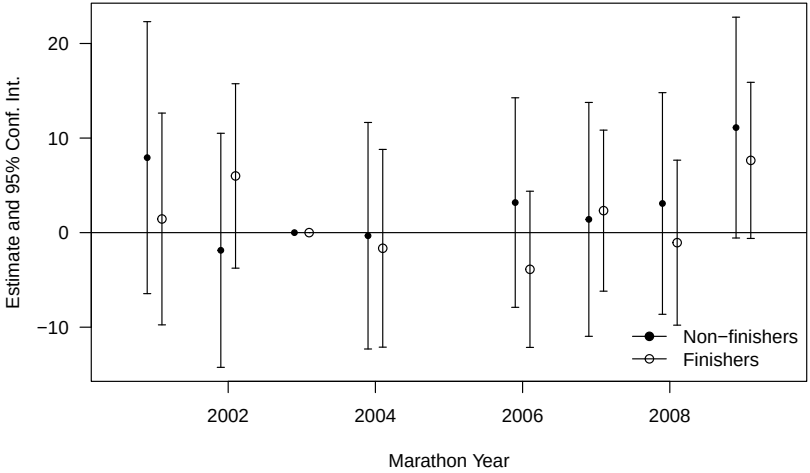
Results: Matched Sample



Results: 2005 "Placebo" Bombing



Results: 2005 "Placebo" Bombing + Matched Sample



Summary

1. The effects of the Boston Marathon Bombing on runners present (both finishers and non-finishers) were long-lasting, unlike the effects on the general population.
2. We find strong performance declines (about 4%) for at least four years. These performance declines also cause reduced participation (runners did not opt out, they were pushed out).
3. As a reference point, in 2017, Nike released the Alphafly shoe which reduced times for elite runners by approximately 4%, and were promptly "outlawed."
4. Our evidence is supported by outcomes in other major marathons, a matching analysis, and a placebo analysis.

Conclusion

- We find terrorist attacks produce sustained reductions in performance even among a highly motivated group of individuals.
- These results have important implications for labor markets: trauma reduces output which could lead to reduced earnings through lower wages (intensive margin) or unemployment (extensive margin).
- Therefore, support for victims must remain in place over long time horizons to be effective (e.g., The Marathon Bombing Victim Assistance program).
